

Documentum: life after Java Applets

Next generation of content transfer

The Problem

Java Applets present security and installation issues, and several browsers have announced the end of support for applets – removing the most user-friendly way of doing content transfer in Documentum

The Solution

In addition to standard HTML5 functionality (e.g. drag and drop import) CARA provides a secure plugin to add the ease of use that Java Applets provided, without the issues.

Standard features

The CARA plugin allows easy checkout, checkin, import, export (including batches) and viewing.

Outlook and Explorer – new features

The plugin also provides the ability to right click on documents in Windows Explorer (or Mac Finder), or on emails or attachments in Outlook, and “Upload to CARA” in a single click.
